DOM

CE

- Threaded, Flanged, and High Pressure Series
- Aluminum or Stainless Steel Bodies
- Measures Liquids with Viscosities to 1,000 cPs (Higher with Special Cut Rotors)
- Operating Pressures to 5,800 PSIG
- Electronics Packages Include Analog and Frequency Outputs, Mechanical or LCD Totalizers, and Batch Controllers
- Bi-directional Flow Capability and Optional Quadrature Output

Positive Displacement Flowmeter Model DOM

Description

The DOM series positive displacement flowmeter is the preferred choice for measuring viscous liquids such as lubricating/hydraulic oils, diesel fuels, chemicals, solvents, resins, and pastes.

The Oval Gear meters are positive displacement flowmeters where the passage of liquid causes two oval gears to rotate within a precision measuring chamber and with each rotation a fixed volume of liquid passes through the meter. Magnets embedded within the gears initiate a high resolution pulse train output. The pulse output can be wired directly to process control and monitoring equipment or can be used as an input to instruments supplied with or fitted directly onto the meter.

The flowmeter is available as a blind transmitter with pulse or 4-20mA output capable of interfacing to most monitoring and control instrumentation or the meter can be fitted with or supplied with instruments such as totalizers, rate totalizers or batch controllers. These instruments also have monitoring and control output options including 4-20 mA, scaled pulse, flowrate alarms and batch control logic (preset metering).

This technology allows precise flow measurement and dispensing of most clean liquids regardless of their conductivity, with other liquid characteristics having no or minimal effect on meter performance. This metering technology does not require flow profile conditioning or straightline runs as required with alternative flow technologies making the installation relatively compact and low cost.

Positive displacement flowmeters are an inexpensive means to accurately meter high viscosity clean liquids as high as 1 million centipoise. The appropriate meter must be sized to accomodate the pressure drop across the primary measuring elements (oval rotors) and to not exceed the maximum pressure capability of the meter.

Specifications

Wetted Material

DOM-A05..DOM-A15

Body: Aluminum

Gear/Bearing: Sintered 316 Stainless Steel/Carbon Ceramic or PPS/No Bearing*

DOM-A20..DOM-A60

Body: Aluminum

Gear/Bearing: Aluminum/Hardened Steel
Rollers (Lubricating Fuels and Oils only) or PPS/No Bearing*

Specifications

DOM-S, DOM-H

Body:

Pulse Output

Reed/Hall Effect Sensor Pulse Output (.H0)

The Hall Effect sensor is a high resolution solid state 3 wire device providing an unsourced, open collector, NPN transistor output. The term "un-sourced" means that no voltage is applied to the output from within the flowmeter, it must be pulled to a "high" or "on" state by between 5 - 24 V_{DC} supplied from an external source, typically the receiving instrument.

The pulse output between signal and -0 V is a voltage square wave with the high level being the DC voltage available at the open collector and the low level being -0 V.

The receiving instrument must incorporate a pull up resistor (typically greater than 10 kΩ in most instruments) which ties the open collector to the available DC voltage level when the Hall sensor is not energized. When energized the open collector output is pulled to ground through the emitter (-0 V).

For the Reed Switch technical description, see the R0 details below.

Hall Effect Power Supply: max. 5-24 V_{DC}, max. 20 mA

Dual Reed Switch Pulse Output (.R0)

The dual reed switch output are two wire normally open SPST voltage free contacts ideal for installations without power or for use in hazardous area locations when Intrinsically Safe (I.S.) philosophy is adopted.

Note: When using the reed switch output the liquid temperature must not change at a rate greater than 50 °F per minute. In general the reed switch life will exceed 2 billion actuations when switching less than 5 V_{DC}/10 mA.

Power Supply: max. 30 V_{DC}, max. 200 mA

Quadrature Hall Effect Pulse Output (.D0)

Two Hall Effect sensors arranged to give separate outputs 90° out of phase with one another. The quadrature output is typically suited to custody transfer applications where signal integrity verification is required, it is also used for metering bi-directional flow.

Power Supply: max. 8 - 24 V_{DC}, max. 20 mA

Mechanical Totalizer (.M4)

The flowmeters type DOM-x20.. up to DOM-x60.. are available with a mechanical totalizer with a 4-digit resettable totalizer and indication of accumulated total value. The motion of the rotors is transmitted to the mechanical register totalizer via an interfacing reduction gear train and dynamic seal assembly. For models DOM-x20.. & DOM-x25.. the resettable totalizer and accumulated totalizer read in x1 gallons. For models DOM-x30.. to DOM-x60.. the resettable totalizer and accumulated totalizer read in x10 gallons.

Signal Converter (.L0)

The L0 signal converter option may be set to function as either a frequency to current converter (2-wire 4-20mA output), a pulse divider, or a single point flow rate alarm. The signal board also has an NPN pulse output which mirrors the input pulse frequency, this signal may be used for remote rate and/or total indication.

Power Supply: 24 V_{DC}

Special Cut Rotors for Higher Viscosities

For viscosity > 1000 cP, special cut rotors option "S" should be used to reduce pressure drop. This applies to DOM-x15 and larger sizes. For higher viscosities, the flowmeter max. flowrate is de-rated according to the table above. Example: DOM-x25 measuring oil at 6000 cP, max. flow 40 GPM x 0.33 = 13.2 GPM new maximum flow rate.
