Chapter 1
Before You Begin

1.1 Overview
This chapter provides an orientation to the use of this manual. This manual describes the procedures required to install the following transmitters:
- Model 2400S transmitter with analog outputs
- Model 2400S transmitter with PROFIBUS-DP
- Model 2400S transmitter with DeviceNet™

1.2 Safety
Safety messages are provided throughout this manual to protect personnel and equipment. Read each safety message carefully before proceeding to the next step.

⚠️ Improper installation in a hazardous area can cause an explosion. When installing in a hazardous area, refer to Micro Motion approvals instructions, shipped with the product or available from the Micro Motion web site.

⚠️ Hazardous voltage can cause severe injury or death. Make sure power is shut off before installing the transmitter.

⚠️ Follow all instructions. Improper installation could cause measurement error or flowmeter failure.

1.3 Flowmeter components
The Model 2400S transmitter is mounted on a Micro Motion sensor. The transmitter and sensor together comprise the Micro Motion flowmeter.

Figure 1-1 provides a view of the Model 2400S transmitter mounted on a sensor.
Before You Begin

1.4 Transmitter installation overview

The Model 2400S transmitter component is mounted integrally with the sensor and grounded via the sensor. To install and ground the sensor, see the sensor documentation.

Additional transmitter installation steps are documented in this manual:
- Rotate the transmitter on the sensor (optional) – see Chapter 2
- Rotate the user interface module on the transmitter (optional) – see Chapter 2
- Wire and ground the transmitter’s power supply – see Chapter 2
- Wire the transmitter I/O:
  - For the Model 2400S Analog transmitter, see Chapter 3
  - For the Model 2400S PROFIBUS-DP and DeviceNet transmitters, see Chapter 4

1.6 Customer service

For technical assistance, phone the Micro Motion Customer Service department:

- In the U.S.A., phone 800-522-MASS (800-522-6277) (toll free)
- In Canada and Latin America, phone +1 303-527-5200 (U.S.A.)
- In Asia:
  - In Japan, phone 3 5769-6803
  - In other locations, phone +65 6777-8211 (Singapore)
- In Europe:
  - In the U.K., phone 0870 240 1978 (toll-free)
  - In other locations, phone +31 (0) 318 495 555 (The Netherlands)

Customers outside the U.S.A. can also email Micro Motion customer service at International.MMISupport@Emerson.com.
Chapter 2
Transmitter Orientation and Power Supply

2.1 Overview
This chapter describes:
- Rotating the transmitter on the sensor (optional)
- Rotating the user interface module on the transmitter (optional)
- Power supply requirements and wiring

2.2 Moisture protection
When rotating or wiring the transmitter, guard against condensation or excessive moisture inside the transmitter housing. Be sure that the conduit openings are completely sealed after all installation and wiring procedures have been performed.

! Improperly sealed housings can expose electronics to moisture, which can cause measurement error or flowmeter failure. Install the meter so that the conduit openings do not point upward, and install drip legs in conduit or cable. Inspect and grease all gaskets and O-rings. Fully close and tighten all housing covers and conduit openings.

2.3 Rotating the transmitter on the sensor (optional)
For easier access to the user interface or the wiring terminals, the transmitter can be rotated on the sensor in 45° increments, for eight different orientations.

To rotate the transmitter on the sensor:
1. Referring to Figure 2-1, unscrew the clamp that holds the transmitter to the feedthrough.
2. Gently lift the transmitter on the feedthrough until it disengages from the notches on the feedthrough. You will not be able to remove the transmitter completely.
3. Rotate the transmitter to the desired position.
4. Lower the transmitter, sliding it onto the notches on the feedthrough.
5. Replace the clamp and tighten the screw.
Transmitter Orientation and Power Supply

Figure 2-1  Rotating the transmitter on the sensor

Do not rotate the housing more than 360°. Excessive rotation can damage the wiring and cause measurement error or flowmeter failure.

2.4 Rotating the user interface module on the transmitter (optional)

For easier access, the user interface module (whether or not the transmitter has an LCD display) can be rotated on the transmitter up to 360° in 90° increments.

To rotate the user interface module on the transmitter:

1. Remove power from the unit.

Removing the transmitter housing cover in a hazardous area while the transmitter is powered up can cause an explosion. Shut off power to the transmitter before removing the housing cover in a hazardous area.

2. Referring to Figure 2-2, remove the transmitter housing cover and user interface module:
   a. Loosen the four transmitter housing cover screws.
   b. Remove the transmitter housing cover.
   c. Loosen the two user interface screws.
   d. Gently lift the user interface module, disengaging it from the user interface connector on the transmitter.

3. On the back of the user interface module, four user interface connectors are provided. Rotate the user interface module to the desired position and plug it into the user interface connector on the transmitter. (See Figure 2-3 for another view of the user interface connector on the transmitter.)

4. Tighten the user interface screws.

5. Replace the transmitter housing cover and tighten the transmitter housing cover screws.

6. Restore power to the transmitter if required.
2.5 Power supply requirements

Model 2400S Analog and Model 2400S PROFIBUS-DP transmitters can accept either AC or DC power. The transmitter automatically recognizes the source voltage. Power supply requirements are:

- **AC power:**
  - 85–265 VAC
  - 50/60 Hz
  - 4 watts typical, 7 watts maximum

- **DC power:**
  - 18–100 VDC
  - 4 watts typical, 7 watts maximum

The Model 2400S DeviceNet transmitter is powered from the DeviceNet network per the DeviceNet specification. There is no need to connect separate power-supply wiring for the Model 2400S DeviceNet transmitter. Skip to Chapter 4.
Transmitter Orientation and Power Supply

2.5.1 DC power requirements for Model 2400S Analog and PROFIBUS-DP transmitters

If you are using DC power with a Model 2400S Analog or PROFIBUS-DP transmitter, the following requirements apply:

- At startup, the transmitter power source must provide a minimum of 1 A of short-term current per transmitter.
- Length and conductor diameter of the power cable must be sized to provide 18 VDC minimum at the power terminals, at a load current of 0.5 A. (This assumes a single transmitter per cable. Connecting multiple transmitters to a single cable should generally be avoided.) To size the cable, refer to Table 2-1 and use the following formula as a guideline:

\[
\text{Minimum Supply Voltage} = 18\ V + (\text{Cable Resistance} \times \text{Cable Length} \times 0.5A)
\]

Table 2-1 Typical power cable resistances at 68 °F (20 °C)

<table>
<thead>
<tr>
<th>Gauge</th>
<th>Resistance (Ω)</th>
</tr>
</thead>
<tbody>
<tr>
<td>14 AWG</td>
<td>0.0050 Ω/foot</td>
</tr>
<tr>
<td>16 AWG</td>
<td>0.0080 Ω/foot</td>
</tr>
<tr>
<td>18 AWG</td>
<td>0.0128 Ω/foot</td>
</tr>
<tr>
<td>20 AWG</td>
<td>0.0204 Ω/foot</td>
</tr>
<tr>
<td>2.5 mm²</td>
<td>0.0136 Ω/meter</td>
</tr>
<tr>
<td>1.5 mm²</td>
<td>0.0228 Ω/meter</td>
</tr>
<tr>
<td>1 mm²</td>
<td>0.0340 Ω/meter</td>
</tr>
<tr>
<td>0.75 mm²</td>
<td>0.0460 Ω/meter</td>
</tr>
<tr>
<td>0.5 mm²</td>
<td>0.0680 Ω/meter</td>
</tr>
</tbody>
</table>

(1) These values include the resistance of both high and low conductors in a cable.

Example

The transmitter is mounted 350 feet from a DC power supply. If you want to use 16 AWG cable, calculate the required voltage at the DC power supply as follows:

\[
\text{Minimum Supply Voltage} = 18\ V + (0.0080\ \text{Ohms/ft} \times 350\ \text{ft} \times 0.5A)
\]

\[
\text{Minimum Supply Voltage} = 19.4\ V
\]

2.6 Wiring the power supply

Note: This procedure is required only for Model 2400S Analog and PROFIBUS-DP transmitters.

To wire the power supply:

1. Remove the transmitter housing cover and user interface module as described in Section 2.4.
2. Unscrew the warning flap screw and raise the warning flap. Figure 2-3 shows the warning flap in the open position.
3. Connect the power supply wires to terminals 9 and 10, as shown in Figure 2-3.
4. Ground the power supply to the transmitter’s internal grounding screw, shown in Figure 2-3.
5. Lower the warning flap and tighten the warning flap screw.
Transmitter Orientation and Power Supply

A user-supplied switch may be installed in the power supply line. For compliance with low-voltage directive 2006/95/EC (European installations), a switch in close proximity to the transmitter is required.

Figure 2-3  Wiring the transmitter power supply
Chapter 3
I/O Wiring – Model 2400S Analog Transmitters

3.1 Overview
This chapter describes how to wire I/O for Model 2400S Analog transmitters.

Note: To wire I/O for Model 2400S PROFIBUS-DP and DeviceNet transmitters, see Chapter 4.

It is the user’s responsibility to verify that the specific installation meets the local and national safety requirements and electrical codes.

3.2 Moisture protection
When rotating or wiring the transmitter, guard against condensation or excessive moisture inside the transmitter housing. Be sure that the conduit openings are completely sealed after all installation and wiring procedures have been performed.

Improperly sealed housings can expose electronics to moisture, which can cause measurement error or flowmeter failure. Install the meter so that the conduit openings do not point upward, and install drip legs in conduit or cable. Inspect and grease all gaskets and O-rings. Fully close and tighten all housing covers and conduit openings.

3.3 I/O options
Table 3-1 lists the options for the transmitter’s two I/O channels. Before wiring Channel B, ensure that you know how it will be configured. For information on configuring Channel B for function and power, see the manual entitled Micro Motion® Model 2400S Transmitters with Analog Outputs: Configuration and Use Manual.

(1) Factory default.
3.4 Wiring the outputs

Hazardous voltage can cause severe injury or death. Shut off power to the transmitter before wiring the transmitter outputs.

A transmitter that has been improperly wired or installed in a hazardous area could cause an explosion. Make sure the transmitter is wired to meet or exceed local code requirements. Install the transmitter in an environment that complies with the classification tag on the transmitter.

To wire the outputs:

1. Remove the transmitter housing cover and user interface module. See Section 2.4 for instructions.
2. Wire the outputs according to the appropriate wiring diagram:
   • For mA output wiring diagrams, see Section 3.4.1.
   • For frequency output wiring diagrams, see Section 3.4.2.
   • For discrete output wiring diagrams, see Section 3.4.3.
   • For a discrete input wiring diagram, see Section 3.4.4.
3. Replace the user interface module and transmitter housing cover.

Note: It is not necessary to open the power compartment to wire the outputs. Do not open the power compartment unless you are also wiring the power supply.

3.4.1 mA output wiring

The wiring diagrams in this section are examples of proper wiring for the Model 2400S mA output. The following options are shown:

• Internal power:
  - Basic mA output wiring – Figure 3-1
  - HART/analog single-loop wiring – Figure 3-2
• External power:
  - Basic mA output wiring – Figure 3-3
  - HART/analog single-loop wiring – Figure 3-4
• HART multidrop wiring, internal or external power – Figure 3-6

Note: If you plan to configure the transmitter to poll an external temperature or pressure device, you must wire the mA output to support HART communications. You may use either HART/analog single-loop wiring or HART multidrop wiring.
I/O Wiring – Model 2400S Analog Transmitters

Figure 3-1  **Basic mA output wiring – Internal power**

820 Ohm maximum loop resistance

Figure 3-2  **HART/analog single-loop wiring – Internal power**

For analog communications:
- 820 Ohm maximum loop resistance

For HART communications:
- 600 Ohm maximum loop resistance
- 250 Ohm minimum loop resistance
I/O Wiring – Model 2400S Analog Transmitters

Figure 3-3 Basic mA output wiring – External power

Excessive current will damage the transmitter. Do not exceed 30 VDC input. Terminal current must be less than 500 mA.

Figure 3-4 HART/analog single-loop wiring – External power

Note: See Figure 3-5 for voltage and resistance values.
Figure 3-5  Required external voltage versus mA load resistance

If communicating with HART, a minimum of 250 Ohms is required.

![Graph showing required external voltage versus mA load resistance.](image)

Figure 3-6  HART multidrop wiring – Internal or external power

![Diagram illustrating HART multidrop wiring.](image)

Note: For optimum HART communication, make sure the output loop is single-point-grounded to an instrument-grade ground.
3.4.2 Frequency output wiring

Frequency output wiring depends on whether you will use internal or external power. The following diagrams are examples of proper wiring for these configurations:

- Internal power – Figure 3-7
- External power – Figure 3-8

![Figure 3-7 Frequency output wiring – Internal power](image)

Output voltage level is +24 VDC ±3% with high resistance load.

*Note: See Figure 3-11 for output voltage versus load resistance.*

![Figure 3-8 Frequency output wiring – External power](image)

Pull-up resistor

*Note: See Figure 3-12 for recommended resistor versus supply voltage.*

Excessive current will damage the transmitter. Do not exceed 30 VDC input. Terminal current must be less than 500 mA.
3.4.3 Discrete output wiring

Discrete output wiring depends on whether you will use internal or external power. The following diagrams are examples of proper wiring for these configurations:

- Internal power – Figure 3-9
- External power – Figure 3-10

Figure 3-9 Discrete output wiring – Internal power

Note: See Figure 3-11 for output voltage versus load information.

Figure 3-10 Discrete output wiring – External power

Maximum sink current: 500 mA

Note: Refer to Figure 3-12 for recommended resistor versus supply voltage.

Excessive current will damage the transmitter. Do not exceed 30 VDC input. Terminal current must be less than 500 mA.
I/O Wiring – Model 2400S Analog Transmitters

Figure 3-11  **Output voltage vs. load resistance – Internal power**

![Graph showing output voltage vs. load resistance for internal power. The graph has a curve indicating the relationship between high level output voltage (Volts) on the Y-axis and load resistance (Ohms) on the X-axis. The operating region is highlighted.]

**Note:** When using a discrete output to drive a relay, choose external pull-up to limit current to less than 500 mA.

Figure 3-12  **Recommended pull-up resistor versus supply voltage – External power**

![Graph showing recommended pull-up resistor range versus supply voltage. The graph has a shaded area indicating the recommended resistor value range.]

**Note:** When using a discrete output to drive a relay, choose external pull-up to limit current to less than 500 mA.
3.4.4 Discrete input wiring

Discrete input wiring depends on whether you will use internal or external power. The following diagrams are examples of proper wiring for these configurations:

- Internal power – Figure 3-13
- External power – Figure 3-14

If external power is configured, power may be supplied by a PLC or other device, or by direct DC input. See Table 3-2 for input voltage ranges.

Chapter 4
I/O Wiring – Model 2400S PROFIBUS-DP and DeviceNet Transmitters

4.1 Overview
This chapter describes how to wire I/O for Model 2400S PROFIBUS-DP and DeviceNet transmitters.

Note: To wire I/O for Model 2400S Analog transmitters, see Chapter 3.

It is the user’s responsibility to verify that the specific installation meets the local and national safety requirements and electrical codes.

4.2 Moisture protection
When rotating or wiring the transmitter, guard against condensation or excessive moisture inside the transmitter housing. Be sure that the conduit openings are completely sealed after all installation and wiring procedures have been performed.

Improperly sealed housings can expose electronics to moisture, which can cause measurement error or flowmeter failure. Install the meter so that the conduit openings do not point upward, and install drip legs in conduit or cable. Inspect and grease all gaskets and O-rings. Fully close and tighten all housing covers and conduit openings.

4.3 I/O wiring for Model 2400S PROFIBUS-DP transmitters
To connect the I/O wiring for a 2400S PROFIBUS-DP transmitter:

1. Remove the user interface cover and user interface module. See Section 2.4 for instructions.
2. Wire the transmitter to the PROFIBUS-DP segment according to the diagram in Figure 4-1. Follow all local safety regulations.
3. Replace the user interface module and user interface cover.

Note: It is not necessary to open the power compartment to wire the outputs. Do not open the power compartment unless you are also wiring the power supply.

Note: The PROFIBUS cable shield is required to be grounded at both ends. At the 2400S, ground the cable shield in an appropriate cable gland. If an optional PROFIBUS-DP Eurofast M12 connector is used, the cable shield is grounded via the threads of the connector.

Hazardous voltage can cause severe injury or death. Keep the power supply compartment closed while wiring the transmitter outputs, or shut off power to the transmitter.

A transmitter that has been improperly wired or installed in a hazardous area could cause an explosion. Make sure the transmitter is wired to meet or exceed local code requirements. Install the transmitter in an environment that complies with the classification tag on the transmitter.
4.3.1 Enabling internal termination

Model 2400S PROFIBUS-DP transmitters have a switch on the user interface module to enable internal termination impedance. Refer to Figure 4-2.

Note: The Model 2400S PROFIBUS-DP transmitter does not have terminals for termination wiring. An external terminator is not required. The transmitter has an internal terminator. There is a switch on the user interface for enabling internal termination. See Section 4.3.1.

Spur to PROFIBUS-DP segment according to the Installation Guideline for PROFIBUS-DP/FMS available at www.profibus.org

Switch to enable internal termination impedance
4.4 I/O wiring for Model 2400S DeviceNet transmitters

Connect the transmitter to the DeviceNet segment according to the diagram in Figure 4-3. The transmitter is shipped with a DeviceNet male sealed Micro Connector (Eurofast) that has been preinstalled and wired according to the DeviceNet specification.

Follow all local safety regulations.

A transmitter that has been improperly wired or installed in a hazardous area could cause an explosion. Make sure the transmitter is wired to meet or exceed local code requirements. Install the transmitter in an environment that complies with the classification tag on the transmitter.

Figure 4-3 Model 2400S DeviceNet I/O wiring

## Interface functions

| All models with or without display | • Suitable for hazardous area installation.  
• User interface module can rotate 360° on the transmitter in 90° increments.  
• Three-color status LED on user interface module indicates flowmeter condition at a glance, using a solid green, yellow, or red light. Zero in progress is indicated by a flashing yellow light.  
• Two clips for service port connections (requires removing transmitter housing cover). |
| Model 2400S Analog with or without display | • Two clips for HART/Bell 202 connections (requires removing transmitter housing cover).  
• HART security switch (requires removing transmitter housing cover). |
| Model 2400S DeviceNet, with or without display | • Three rotary switches for selecting network address and baud rate (network address and baud rate are also software selectable).  
• Module and network LEDs to indicate DeviceNet status. |
| Model 2400S PROFIBUS-DP, with or without display | • Three rotary switches for selecting network address (network address is also software selectable).  
• DIP switch for enabling internal termination resistor.  
• Address and network LEDs that indicate PROFIBUS-DP status. |
| All models with display | • Depending on purchase option, transmitter housing cover has glass or plastic lens.  
• User interface module includes LCD panel. LCD line 1 displays process variable; line 2 displays engineering unit of measure.  
• Display update rate is user-configurable: 1 to 10 seconds at 1-second increments.  
• Display backlighting may be adjusted or turned off.  
• Operator access to transmitter menus is provided via optical switches that are operated through the lens. LED indicators show when a “button” has been pressed.  
• Infrared port allows access to service port from IrDA device (e.g., PDA running Pocket ProLink) without removing transmitter housing cover. |
| All models without display | • Transmitter housing cover is all metal (no lens).  
• Access to user interface requires removing transmitter housing cover.  
• Zero button allows flowmeter zero from field (requires removing transmitter housing cover).  
• No IrDA. |
### Dimensions and Specifications

#### A.6 Input/output signals

<table>

## Dimensions and Specifications

### A.9 Environmental limits

<table>
<thead>
<tr>
<th>Specifications</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ambient temperature limits</td>
<td>Operating and storage: –40 to +140 °F (–40 to +60 °C)</td>
</tr>
<tr>
<td></td>
<td>Below –4 °F (–20 °C), LCD responsiveness decreases and LCD may become difficult to read. Above 131 °F (55 °C), some darkening of the LCD panel might occur.</td>
</tr>
<tr>
<td></td>
<td>ATEX requires limiting ambient temperature to below 131 °F (55 °C).</td>
</tr>
<tr>
<td>Humidity limits</td>
<td>5 to 95% relative humidity, non-condensing at 140 °F (60 °C)</td>
</tr>
<tr>
<td>Vibration limits</td>
<td>Meets IEC68.2.6, endurance sweep, 5 to 2000 Hz, 50 sweep cycles at 1.0 g</td>
</tr>
</tbody>
</table>

### A.10 Environmental effects

All models  
EMI effects  
Complies with electromagnetic compatibility directive 2004/108/EC per EN 61326 industrial  
Conforms to NAMUR NE21 Version: 10.02.2004  

Model 2400S Analog only  
Ambient temperature effect  
On mA output: ±0.005% of span per °C

### A.11 Hazardous area classifications

(1) CSA is a Canadian approvals agency that provides approvals accepted both in the U.S.A. and in Canada.  
(2) ATEX is a European directive.
Appendix B

Return Policy

Micro Motion procedures must be followed when returning equipment. These procedures ensure legal compliance with government transportation agencies and help provide a safe working environment for Micro Motion employees. Failure to follow Micro Motion procedures will result in your equipment being refused delivery.

Information on return procedures and forms is available on our web support system at www.micromotion.com, or by phoning the Micro Motion Customer Service department.

B.1 New and unused equipment

Only equipment that has not been removed from the original shipping package will be considered new and unused. New and unused equipment requires a completed Return Materials Authorization form.

B.2 Used equipment

All equipment that is not classified as new and unused is considered used. This equipment must be completely decontaminated and cleaned before being returned.

Used equipment must be accompanied by a completed Return Materials Authorization form and a Decontamination Statement for all process fluids that have been in contact with the equipment. If a Decontamination Statement cannot be completed (e.g., for food-grade process fluids), you must include a statement certifying decontamination and documenting all foreign substances that have come in contact with the equipment.
