Installation

The installation wiring and related workmanship must be in accordance with the National Electrical Code.

DC Power to the unit should be turned off during installation and systematically applied as described in the Start-Up and Commission section.

If the surrounding area contains flammable materials then suitable safety precautions need to be observed when carrying out the installation.

The AMP-2 is commonly provided in a variety of enclosures. The style of the enclosure has been specified when ordering. (See ordering information for details.) In addition the Amp-2 may have been supplied with additional accessories such as a flow meter mounting kit (TFM-MK-XXX) and/or an input signal cable for the magnetic pickup (CA-TFM-2-18-FL). See illustrative photos below for details.

See the dimension drawings for the details of the mechanical installation for your unit. The following summarizes the installation of the signal cable, mounting kit, and AMP-2 on top of a turbine flow meter in a typical installation.

The signal cable (For example CA-TFM-2-18-FL) is first plugged into the magnetic pickup of the turbine flowmeter.

The union of the mounting kit is taken apart. A portion of the kit mounts to the turbine flow meter. The other portion screws into the housing for the AMP-2.

The signal cable is fed through the union and into the housing for the AMP-2.

The two halves of the union are joined and tightened with convenient service access to the enclosure provided.

In some other installations it may be necessary to remove the printed circuit board from the enclosure during the mechanical assembly of threaded connections.

In some other installations of the AMP-2-O, only the circuit card assembly is provided and the enclosure and its mounting provided by the customer (or other OEM).

It is important to consider mounting and using suitable sealing fixtures for cables run to the enclosure to prevent the accumulation of condensate within the enclosure.

Verify the enclosure cover seals are present to prevent entry of moisture within the enclosure.

Desiccants are recommended to prevent condensate from forming on the circuit assembly in cold weather.

After the mechanical assembly has been completed proceed to the Electrical Wiring Installation.
Dimensions

**OEM Mount** (Mounting option 0):

- Mounting holes are 0.12" in dia.

**NEMA4 Wall Mount** (Mounting option 1):

- 0.315" (8) for 1/2" hub fitting
- 1.77" (45) for 3/4" hub fitting

**Explosion Proof** (Mounting option 2):

- 0.875" dia. conduit entry for 1/2" hub fitting
- 1.125" dia. conduit entry for 3/4" hub fitting

Dimensions for various options are shown in the diagrams provided.
User Electrical Wiring Installation

The AMP-2 contains two input channels that are intended to be connected to magnetic pickups. A high level pulse is provided on each of the channel outputs. The AMP-2 is intended to be powered by a DC Voltage of between 8.5 and 30 Vdc.

The two channels can be used in a variety of ways to suit the intended application:
1. One Magnetic Pickup wired to Channel A with a pulse output on Channel A (Channel B is a Spare)
2. One Magnetic Pickup wired to channels A and B to provide two pulse outputs on Channel A and B
3. Two Magnetic Pickups (one on channel A the other on channel B)

The magnetic Pickup for Channel A is wired to terminals 1 and 2. Note that there is normally no polarity on magnetic pickup sensors. A shield may be connected to terminal 3 if desired. It may be necessary to install a ground on either terminal 3 or 7 or 9 if shields are used.

The magnetic Pickup for Channel B is wired to terminals 4 and 5 if used. Note that there is normally no polarity on magnetic pickup sensors. A shield may be connected to terminal 3 if desired. It may be necessary to install a ground on either terminal 3 or 7 or 9 if shields are used.

The pulse output for Channel A is wired to terminals 8 (+) and 9(-). A shield may be connected to terminal 9 if desired. It may be necessary to install a ground on either terminal 3 or 7 or 9 if shields are used.

The pulse output for Channel B is wired to terminals 10 (+) and 9(-). A shield may be connected to terminal 9 if desired. It may be necessary to install a ground on either terminal 3 or 7 or 9 if shields are used.

DC Power is wired to terminal 6(+) and Terminal 7(-).
**Startup and Commissioning**

Verify that the enclosure rating is suitable for the intended installation site. Verify workmanship.

Verify the following wiring connections before applying the DC Power Voltage to the unit:

1. A DC Supply with a Voltage between 8.5Vdc and 30 Vdc is connected 6 (+) and 7 (-)
2. The magnetic pickup for sensor on channel A input is wired to terminals 1 and 2 (no polarity required)
3. The pulse output for channel A is wired to terminals 8 (+) and either 7 or 9 (-)
4. Shields may optionally be connected on either 3 or 7 or 9
5. Earth ground may be required on either 3 or 7 or 9.

If Channel B is being used the following connections should be verified:

6. The magnetic pickup for sensor on channel B input is wired to terminals 4 and 5 (no polarity required)
7. The pulse output for channel B is wired to terminals 10(+) and either 7 or 9 (-)
8. Shields may optionally be connected on either 3 or 7 or 9
9. Earth ground may be required on either 3 or 7 or 9.

Apply the DC Power.

There should be no false pulse output present during periods of no flow. The receiving equipment should not register false signals under these conditions.

The receiving equipment should properly register flow once a signal is generated by the magnetic pickup.

**Operation**

The operation of the AMP-2 is automatic after the installation is complete. The output should generate a frequency pulse output signal in response to the low level sinusoidal milli-volt signal from the magnetic pickup.

Normal operation can be assumed when the following conditions have been verified:

1. There is no false output pulse signal during periods of no flow (no intended input signal present).
2. There is a valid frequency pulse output signal at the minimum flow rate in the application
3. There is a valid frequency pulse output signal at the maximum flow rate in the application
Specifications

Description
The KEP AMP-2 is a two channel amplifier for use with magnetic pickups. It amplifies and squares the low level signals from a magnetic pickup to drive any ratemeter, totalizer or controller. The unit operates from 8.5 to 30 VDC. It has a 10K pullup resistor attached to the open collector output and sinks a minimum of 20 mA to less than 1 V from a maximum of 30 VDC. It is available in OEM (PC board only), NEMA4X enclosure or in a rugged explosion proof housing with screw terminals for easy installation. Operating temperature is -40° to 65°C.

Note: The low voltage line from the magnetic pickup to the AMP-2 should be less than 10 ft. in length, shielded and isolated from relays, solenoids or other sources of electrical noise (let the output line make the long run). If the input is too sensitive, lower the 10K input impedance by adding a 1K ohm resistor across TB1, pins 1 and 2, 4 and 5 to increase noise immunity.

Environmental
TEMPERATURE: -40° to 65°C
HUMIDITY: 0-95% Noncondensing

Power Input:
Input Voltage Range: 8.5 to 30 VDC
Supply Current: 25 mA (nominal)
Reverse Polarity Protection
Transient Protection: Surge Suppression Clamp at 36V

Magnetic Pickup
Sensitivity: 10 mV p-p
Bandwidth: 0-4000 Hz
Over Voltage Protection to 30 VDC
10 KΩ input resistance
Type: Differential Preamplifier

Pulse Output
Maximum Voltage: DC Input
Maximum Current: 100 mA @ .7V max
Reverse Polarity Protection
Overcurrent Protection
Surge Suppression Clamp at 36V

Listing for Ex-Proof Option
CSA for Canada and USA
Class I Division 1 Groups B,C,D
Class II Division 1 Groups E,F,G
Class III
Enclosure: Type 4X

Enclosure
0- OEM No Enclosure; for use in OEM mounting applications
1- NEMA4X NEMA 4X Wall Mount Enclosure
2- Ex Proof (FM/CSA), NEMA 4X, Die Cast Aluminum, 3 Port Instrument Housing With Blind Cover
