Safety information

⚠️ CAUTION!

SENSOR/PROCESS APPLICATION COMPATIBILITY

The wetted sensor material may not be compatible with process composition and operating conditions. Application compatibility is entirely your responsibility.

⚠️ CAUTION!

EQUIPMENT DAMAGE

Do not exceed pressure and temperature specifications.

Pressure: 65 psig (549 kPa abs) max. Temperature: 32 to 122 °F (0 to 50 °C)

1 Plan

1.1 Unpacking and inspection

1. Inspect the shipping container. If it is damaged, contact the shipper immediately for instructions.
2. Save the box.
3. If there is no apparent damage, unpack the container. Be sure all items shown on the packing list are present. If items are missing, notify Rosemount immediately.

1.2 Product description

Figure 1-1: Rosemount 499ATrDO Sensor Parts

A. Membrane retainer
B. Membrane assembly
C. O-ring
D. Cathode
E. Electrolyte fill plug (wrap with pipe tape)
F. Pressure equalizing port
G. Sensor cable (integral cable shown)

1.3 Specifications

Table 1-1: Sensor specifications

\(^{(1)}\) Temperature and pressure specifications for the low flow cell exceed the temperature and pressure specifications for the sensor.
2 Install

The gray PVC cap contains a solution of sodium sulfite. Remove the cap before installing the sensor.

⚠️ WARNING!

POISONOUS SUBSTANCE
The cap contains sodium sulfite solution. Avoid contact with skin or eyes. Do not swallow!

When making a connection through a junction box (PN 23550-00), wire point-to-point.

**NOTICE**

Use a wire nut and pigtail (included) when connecting several wires to the same terminal.
4 Calibrate

4.1 Zero point calibration

Even in the absence of oxygen, the Rosemount 499ATrDO sensor generates a small signal called the zero current. Normally, the zero current is less than 5 nA, which introduces no more than a 0.5 ppb error in measurement. Zero the sensor when it is first placed in service and every time the fill solution is changed.

To zero the sensor:

Procedure

1. Pour a cup of deionized or bottled water.
2. Add a teaspoon of sodium sulfite to the water.
3. Place the sensor in the water.
4. Wait until the sensor current has reached a stable low value (at least two hours).
5. Measure the current.
   a. If it is less than 5 nA, do not zero the sensor.
   b. If it is between 5 and 10 nA, allow the sensor to run overnight. Zero the sensor if the reading is still between 5 and 10 nA and is stable.
   c. If it is greater than 10 nA, call the factory.

4.2 Full scale

The Rosemount 499ATrDO sensor is best calibrated by exposing the sensor to water-saturated air.

1. Pour a small amount of water into a cup.
2. Suspend the sensor, keeping the membrane dry, about 1/4 in. (6 mm) above the surface of the water.
3. Once readings are stable, which should take no longer than 20 minutes, follow the analyzer prompts to complete the calibration.

   The analyzer automatically calculates the equilibrium solubility of atmospheric oxygen in water under the prevailing temperature and barometric pressure.

4. After calibration, go to the Diagnostics menu and check the sensitivity.

   The sensitivity should be between 3,600 and 6,100 nA/ppm.

   For more information, refer to the transmitter manual.
Prolonged exposure to air may affect the linearity of the sensor. If the cumulative exposure to air is less than about five hours per year, sensor linearity should be within specification. If cumulative exposure exceeds five hours per year, restore linear response of the sensor by draining the electrolyte solution and replacing it with fresh.
5 Maintenance

Periodic maintenance and cleaning are required for best performance of the sensor. Generally, the membrane and fill solution should be replaced every four to six months. The optimum maintenance frequency is best determined by experience. Periodically check the zero current and sensitivity. If the zero current is less than about 5 nA, and the current in the air is between 30 and 45 nA with a variability of less than 2%, the sensor does not need maintenance.

**WARNING!**

PRESSURIZED SPRAY INJURY
Before removing the sensor, be absolutely certain that the process pressure is reduced to 0 psig and the process temperature is lowered to a safe level!

5.1 Cleaning the membrane

Keep the membrane clean and free from solid corrosion products. Clean the membrane with water sprayed from a wash bottle or gently wipe the sensor with a soft, clean tissue.

5.2 Replacing the electrolyte solution and membrane

**WARNING!**

HARMFUL SUBSTANCE
Fill solution may cause irritation. May be harmful if swallowed. Read and follow manual.

**Procedure**

1. Unscrew the membrane retainer.
2. Remove the membrane assembly and O-ring.
   
   See *Figure 1-1*.
3. Hold the sensor over a container with the cathode pointing down.
4. Remove the fill plug.
5. Allow the electrolyte solution to drain out.
6. Inspect the cathode.

   a. If it is tarnished, clean it by gently rubbing in the direction of the existing scratches (do not use a circular motion) with 400-600 grit silicon carbide finishing paper.
7. Remove the old pipe tape from the plug.
8. Wrap the plug with one or two turns of pipe tape.
   a. Hold the membrane assembly with the cup formed by the membrane and membrane holder pointing up.
   b. Place a drop of isopropyl alcohol in the cup.
   c. Slowly add about 20 drops of electrolyte solution to the cup.
      This step is important, because alcohol wets the inside surface of the membrane and ensures that no air bubbles will be trapped when the membrane assembly is placed over the cathode.
   d. Fill the cup with electrolyte solution.
   e. Leave the membrane assembly filled with electrolyte solution and set it aside.
10. Hold the sensor at about a 45° angle with the cathode end pointing up.
11. Add electrolyte solution through the fill hole until the liquid overflows.
12. Tap the sensor near the threads to release trapped air bubbles.
13. Add more electrolyte solution if necessary.
14. Place the fill plug in the electrolyte port and begin screwing it in.
15. After several threads have engaged, rotate the sensor so that the cathode is pointing up and continue tightening the fill plug.
       Do not overtighten.
16. Place a new O-ring in the groove around the cathode post.
17. Cover the holes at the base of the cathode stem with several drops of electrolyte solution.
18. Insert a small blunt probe, like a toothpick with the end cut off, through the pressure equalizing port.
       See Figure 1-1.

   **CAUTION!**
   **EQUIPMENT DAMAGE**
   Do not use a sharp probe. It will puncture the bladder and destroy the sensor.

19. Gently press the probe against the bladder several times to force liquid through the holes at the base of the cathode stem. Keep pressing the bladder until no air bubbles can be seen leaving the holes. Be sure the holes remain covered with electrolyte solution.
20. Place a drop of electrolyte solution on the cathode; then place the membrane assembly over the cathode.
21. Screw the membrane retainer in place.
       The sensor may require several hours operating at the polarizing voltage to equilibrate after the electrolyte solution has been replenished.
5.3 Storage

Store the sensor with the membrane immersed in a fresh solution of saturated sodium sulfite. You can use the PVC cap shipped with the sensor. Leave the power to the transmitter turned on.
