PACSystems™ RX3i CPUs
Industrial Internet Ready

Equipment builders are continuously looking for ways to improve the performance and flexibility of their equipment while reducing size and complexity. Fast, easy-to-configure connectivity to Emerson’s PACSystems controllers and extensive range of I/O options enable scalable machine automation and highly distributed modular machine designs. The end result is high performance automation for the industrial internet.

**High Performance**

Analyze and improve even the most complex application right at the source. The latest RX3i CPUs now offer multiple processing cores, allowing you to do more with your CPUs. A large working memory in every high-speed RX3i CPU lets you store more data and access it faster than ever before. The RX3i offers premier high-speed performance and data handling across any multi-disciplined control system. Whether you’re accessing consistent gigabit speed data across the backplane or over fiber, kilometers away, the RX3i CPUs are built for rapid, reliable performance.

**PROFINET Advantage**

PROFINET I/O solutions can provide productivity and performance advantages for virtually any type of control application in a range of industries. Connect to any of Emerson’s purpose-built I/O families through a PROFINET interface for advanced flexibility and performance.

**Best Availability**

Can your process controller keep up with system demands? Many of today’s controllers take ten milliseconds or more to switchover in the event of a fault or other system event. Often controllers are also limited in real I/O connections due to bottlenecks in overall data collection. Eliminate delays by combining RX3i and PROFINET to get gigabit speed everywhere and bumpless switchover. Choose RX3i High Availability and prevent unexpected failure and costly downtime.

- Simple configuration, maintenance and operation
- Single point of connect no matter what distance
- High-speed communication for real-time control
- Advanced asset management with Hart pass-through I/O

**Flexibility and Scalability**

PACSystems provides a vast amount of I/O, communications, and specialty modules to handle a variety of process and discrete applications. It provides one of the best migration paths in the industry with the ability to bring Series 90-30 modules directly into the PACSystems backplane to save rewiring and space. In addition, programs move with ease to the new programming and configuration environment, PAC Machine Edition, getting applications up and running in minutes.

**Secure by Design**

With defense-in-depth architectures and security built-in, we secure assets from potential cyber threats to protect our customers’ most important assets. RX3i CPUs prioritize security with technologies such as Trusted Platform Modules (TPM) and digitally signed firmware. Understanding industrial controls are constant targets of cyber threats, we’ve also designed all RX3i CPUs to protect against harmful man-in-the-middle and denial of service attacks as indicated by Achilles Level 2 Certifications. Encrypted communications are executed through OPC UA while a broad suite of cyber-security tools help prevent unauthorized updates.
