Model UP750 Program Controller
(with Custom Computation)

GS 05E01B02-01E

General Specifications

Model UP750 Program Controller is an intelligent, microprocessor based program controller that has the capacity of 300 program patterns, powerful control capability, custom computation function and a user-friendly display. The UP750 has many control modes as standard, and all these functions such as program setting function, control function, control computation function, signal computation, etc. can be configured by using the keys on the front panel. The instrument includes eleven types of predecided control strategies including cascade, temperature/humidity, and more in single or dual loops. Auto-tuning control, an overshoot suppressing function "SUPER" and a heating suppressing function "SUPER 2" are standard.

Main Features

- Extra-large digital display allows the indicated values to be read even from along distance. LEDs of 20mm height are used for the process variable display. This is a five-digit display for higher resolution.
- User-friendly full dot LCD display. Not only the target setpoint and control related parameters, but also a program pattern, deviation trend record or an analogue bargraph of control output value can be displayed on it.
- Huge capacity of 300 program patterns / 3000 segments. Applicable to a wide range of heat treatment, textile, environmental chamber and testing application.
- Eleven type of control function, including single-loop control, cascade control, loop control with PV auto-selector, and custom computation function, enabling the operator to start control operation immediately after simply entering the settings.
- The program pattern-2 retransmission function outputs a program pattern (control setpoint) by way of the retransmission output. This function is used in combination with retransmission output setup parameter RET 1 or RET 2, for which target setpoint-2 (SP2) should be selected, and is used for pattern transmission to another instrument (available for UP mode 1, 2, or 6).
- Custom Computation capability, which allows users' own configuration for signals, enables them to realize such functions as complicated computation for input compensation or sequence logic for input/output. ( "PC-based Custom Computation Building Tool <model name: LL200> is necessary to use this function.)
- Universal input and output enable users to set or change freely the type of measured inputs (thermocouple, RTD, or DCV), measurement input range, type of control output (4 to 20 mA current, voltage pulse, or relay contact) etc. the front panel.
- Equipped with seven contact inputs and outputs each, which are further expandable up to 23 inputs and outputs each by adding contact I/O signal expansion modules.
- Various communication function are provided. Communication is possible with personal computer, programmable logic controller, and other controllers.

Functional Specifications

- Program Setting Function
  “Program setting” allows the setting of a setpoint versus time. The instrument can store program patterns and change the pattern according to the operating status. One program pattern consists of several broken line (segment). The length of each segment can be set by segment time. Users can also configure the number of Repeats, Start/Stop, event outputs, etc.
  - Program pattern setting capacity: 300 maximum
  - Number of segment/pattern: 99 maximum
  - Number of segment: 3000 maximum (sum of segments for all program patterns)
  - Number of event: 4000 maximum (sum of events for all program patterns)
  - Number of program repeat time: 0 to 999, or unlimited repeats
  - Segment time: 0 minute 0 s to 59 minute 59 s, or 0 h 0 minute to 59 h 59 minute
  - Mode of program pattern operation:
    - Start (RUN), stop (RESET), paused (hold), advance, can be executed by an external contact or instrument operation.
  - Switching between program patterns:
    - Achieved by contact input or instrument operation.

Example of program pattern
Wait Function

The function to delay the progress of the program pattern when Process variable (PV) does not reach the change of the target setpoint (SP). The wait function has two parameters: a wait zone and a wait time.

Wait zone is a range of the deviation, and wait time is the time to wait for PV to reach the wait zone. If PV reaches the wait zone within a certain time (wait time), then the program will advance to the next segment. If PV does not reach the wait zone even after the wait time pass, then the program will eventually advance to the next segment.

Wait time: OFF, 0 minute 1 s to 99 minute 59 s or 0 h 1 minute to 99 h 59 s.
Wait zone: 0 to 10 % of measured input range width.

UP mode and Program Setting Function

UP mode with one channel of control: Single-loop control, Cascade primary-loop control, Loop control with PV switching, Loop control with PV auto selector, Loop control with 2 universal inputs switching, Cascade control, Cascade control with 2 universal inputs. Note that Program pattern setting function is only available with the cascade primary-loop when Cascade control with 2 universal inputs are used.

UP mode with two channels of control: Dual-loop control, Temperature and humidity control. The following functions are common to dual program setting functions (“Program pattern RUN/RESET”, “The total number of program segment”) and “Segment time”.

Program Setting Function and PID Parameters Switching

Controller can switch between PID parameter sets as a program pattern progresses.

Segment PID selection: PID-parameter numbers being used can be selected on a segment basis.

Zone PID selection: PID parameter sets are selected depending on the value of the applied PV input. Either the reference point method (reference point: a setpoint for switching between PID parameter sets) or the deviation method is used for the switching.

Reference point method: Divides the measurement input range into as many as seven zones using a maximum of six reference points, and switching between PID parameter sets is done on a segment basis.

Reference deviation method: Switches between PID parameter sets depending on whether the control deviation (DV) is within the given reference deviation or exceeding the deviation. This method has priority over the reference point method during operation.

Time Events

Time event is selected based on time in the program pattern

Number of time events: 0 minute 0 s to 99 h 59 minute.

PV Events

PV event is the PV/DV alarm function which is configured in relation with the program pattern.

Number of PV event: max. 8 points per segment
PV event display: 2 points (PVE1, PVE2)

The status of all the setting events can be seen in the operating display.

Event types: PV high limit, PV low limit, Deviation high limit, Deviation low limit, Deenergized on deviation high limit, Deenergized on deviation low limit, Deviation high and low limits, High and low limits within deviation, Deenergized on PV high limit, Deenergized on PV low limit, SP high limit, SP low limit, Output high limit, Output low limit.

Configurable ranges of PV events:

PV alarm: –100 to 100% of measured input range
DV alarm: –100 to 100% of measured input width
Alarm hysteresis: 0.0 to 100% of measured input range width

Instrument Alarm Functions

The instrument alarm function outputs PV, deviation, SP, and other alarm without regards to the program pattern. Controller has four instrument alarm outputs.

Alam types: PV high limit, PV low limit, Deviation high limit, Deviation low limit, Deenergized on deviation high limit, Deenergized on deviation low limit, Deviation high and low limits, High and low limits within deviation, Deenergized on PV high limit, Deenergized on PV low limit, SP high limit, SP low limit, Output high limit, Output low limit.

Event Output Functions

Output contact: Max. 7 points of contact output can be used
PV event: 2 points
Time event: 4 points

Fault diagnostic alarm: Input burnout, A/D conversion error, RJC error
FAIL output: Abnormality in Software, Abnormality in Hardware

Number of Instrument Alarm Settings: 4 points
Number of Instrument Alarm Outputs: Max. 4 points
One of PV alarm/Deviation alarm, Fault diagnostic alarm, Sensor grounding alarm and Fail output can be output with contact output.

Event Output Functions

Output contact: Max. 7 points of contact output can be used to output the event/alarm (See “Contact output”) The following number are pre-configured as an initial setting upon shipment.

Time event: 4 points
PV event: 2 points
Instrument alarm: 1 point
Max. 23 points outputs are available when Expansion Digital I/O connected.

Time events, PV events and Instrument alarm can be assigned for any contact output. Event and alarm status can be read by communication.
● Control Functions

UP mode
The following types of basic control structure can be set as the UP mode by the user.

- Single-loop Control (UP mode 1): The most simple and basic control function.
- Cascade primary-loop control (UP mode 2): Output tracking function and cascade control logic are provided. Suitable for the primary-loop cascade control.
- Cascade control (UP mode 4): Dual control functions. Whole Cascade control can be executed with a single instrument.
- Loop control with PV switching (UP mode 6): Two measured inputs are switched for control depending on the status of contact input or measured input.
- Loop control with PV auto-selector (UP mode 7): Two measured inputs are automatically selected for control with a high, low, average, or temperature-difference value selector.
- Dual-loop control (UP mode 11): Dual control function is available in a single instrument to control two loops.
- Temperature and Humidity control (UP mode 12): Temperature control and Relative Humidity control are available in a single instrument.
- Cascade control with two universal inputs (UP mode 13): Cascade control with using two universal measured inputs.
- Loop control with PV switching and two universal inputs (UP mode 14): Loop control with PV switching and two universal inputs available as measured inputs.
- Loop control with PV auto-selector and two universal inputs (UP mode 15): Process variable for loop control is automatically selected from two or three measured inputs by an internal selector, using two universal inputs and an auxiliary analog input. When two universal inputs are configured as measured input, auxiliary analog input can be used for a remote setpoint input.
- Custom computation control (UP mode 21): Can be provided by the user using the optional LL200 custom computation building tool.

● Control Computation Functions

In each UP mode, the following control types can be selected.

- Continuous PID control, Time-proportional PID control, Relay ON/OFF control, Heating/Cooling control.

  Target setpoint and PID parameter: Maximum eight sets of target setpoint and PID parameters can be set and stored in a instrument. For Cascade control and Dual-Loop control type, eight sets for each main and slave are available.

  Auto-tuning: standard Possible to activate auto-tuning for both loops of Cascade control, Dual-loop control and Temperature and humidity control.

  “SUPER” function: Overshoots generated by abrupt changes in the target setpoint or by disturbances can be suppressed.

  “SUPER 2” function: This function stabilizes the state of control that is unstable due to hunting, etc.

  Preset output function: When the instrument is in reset mode, measured input is burnout, or abnormality is found in an input circuit, users’ preconfigurable preset value is output as a control output.

  Control cycle time: Each cycle time can be selected under the following conditions

  - 100 ms: Available when model code is UP750-0 □.
  - 200 ms: Available with UP750-5 □, or when the amount of computation module of Custom computation function is less than 30.
  - 500 ms: Available when the amount of computation module is 50 or more.

  (Set value on shipped from the factory: 200 ms)

Operation Mode Switching
(Note: Communication enables all the following mode switching to be executed.)

AUTO/MANUAL switching: Bump-less switching is available. Switching between AUTO and MANUAL mode can be realized by instrument operation or by external contact, and external contact switching has priority to instrument operation.

RUN (PRG)/STOP (RESET) switching: Switching can be realized by the front key or external contact, and external contact switching takes priority to the front key. Bump-less switching for RESET to PROG is available. In PROG mode, control computation is activated. In RESET mode, control computation ceases and preset output value is output as a control output, while other functions operates normally.

CASCADE/Local SP switching: Switching can be realized by instrument operation or external contact, and external contact switching takes priority to instrument operation. Available when UP mode is set to “Cascade control”.

Control Parameter Setting Range

- Proportional Band: 0.1 to 999.9% (for heating/cooling PID control), 0.0% available for ON/OFF control.
- Integral time: 1 to 6,000 s, or OFF(for Manual reset)
- Derivative time: 1 to 6,000 s, or OFF
- ON/OFF control hysteresis: 0.0 to 100.0% of measured input range width
- Preset output value: –5.0 to 105.0% of output range (0mA or less cannot be output)

Output limiter:
- Setting range: –5.0 to 105.0% for both high and low limits.
  However “low limit setpoint < high limit setpoint” must be satisfied.
- In case of heating/cooling PID control, upper limiter for heating and upper limiter for cooling.
- Shutdown function: In manual mode operation, up to approx. 0mA can be output. (For 4 to 20 mA control output only)
- Rate of change limiter for output: OFF, or 0.1 to 100.0%/s
- Dead band for heating/cooling control: –100.0% to 50.0% of output value

without requiring any change in PID constants, when the load and/or gain varies greatly, or when there is a difference between the characteristics of temperature zones.
● Configuration of Input/Output Signal

Measured Input Computations
Bias (-100.0 to 100.0%), First lag filter (OFF, time constant 1 to 120 s), Square root extraction (for voltage input only, Input low cut 0.0 to 5.0%), 10-segment line linearizer/bias function, relative humidity calculation for wet/dry bulb (for Temperature & Humidity control type only)

Auxiliary Input Computations
Bias (-100.0 to 100.0%), Filter (off, time constant 1 to 120 s), Square root extraction (Input low-cut 0.0 to 5.0%).

Custom Computations
LL200 Building tool is necessary for using Custom computation function.
Combining computation function modules allows such functions as user configuration of input/output signals, operation mode switching via discrete input, status output via discrete output, and so on.

Computation function module: Addition/subtraction/multiplication/division, Processing absolute value/reciprocal, Selecting maximum/minimum/average, Keeping maximum/minimum value, Keeping value, Rate of change limiter, Switch, Limiter, Constant, AND, OR, Exclusive OR, NOT, Latch, Comparison(=, <, >, ≥, ≤), Not equivalent, Within range, AND(word), OR(word), Shift word, Sum, Timer, Ten-segment linearizer 1/2, Inverse ten-segment linearizer 1/2, Curve linearizer 1/2, Ratio, First order lag filter, Conversion to engineering unit, Selection of PV from two inputs, Temperature and humidity calculation, Fluid Temperature/Pressure compensation, MV selection, Conversion of display value, Parameter setting, Data display 1/2, Special discrete output calculation, Assignment of output terminals 1/2, etc.

Maximum Number of Module to be used:
50 for input Custom computation, 50 for output Custom computation

● Display and Operation Function

PV Display Unit
Either PV1 or PV2 can be displayed on 5 digit digital display unit and switched one from the other. (Digit of display: 4 or 5 digit) For Thermocouple and RTD input, the display of the digits lower than decimal point can be off.
The display range is -19999 to 30000 and the display span is 30000 or less. [750.00 appearing in the product photograph on page 1 cannot actually be displayed.]

LCD Display Unit
Some data are displayed on LCD display unit. Each screen is called “display”.
Five types of display are provided: Operating display, Operating parameter setting display, Program parameter setting display, Setup parameter setting display and SELECT display.
Each screen of LCD display unit contains:
Operating display: Necessary data for operation is displayed according to UP mode.
Such items as Program pattern, Setpoint, Control output, control output bar, deviation trend, is displayed.
Time base of deviation trend is 120 s to 20 h.

Operating parameters setting display: The Operating parameters, which are mainly changed during operation, such as PID constant, are displayed. The explanation of each parameters is provided.
Program Parameters Setting display: Generation of Program pattern, and parameters for Wait Function and Repeat Function are displayed.
Setup parameter setting display: The Setup parameters to configure functions of the instrument before starting operation are displayed. The explanation of each parameters is provided.
SELECT display: Up to 5 displays which are frequently accessed can be selected from Operating parameter setting display and Setup parameters setting display.

Status Lamps
Event indicating lamp: 7 points (TME1, TME2, TME3, TME4, PVE1, PVE2, AL)
Operation mode indicating lamp: PRG (Program operation), RST (Program operation reset), LOC (Local operation), MAN (Loop1 in Manual mode), MAN2 (Loop2 in Manual mode), CAS (Cascade operation).

Operation Key
▲, ▼ key: Increase/decrease the value of Setpoint or other parameters which appear on LCD display.
SET/ENT key: Switch data to be showed on LCD display
SET/ENT key: Set/change the setting value, switch information to be showed on LCD display, switch operation mode other than AUTO/MAN.
△ PT No. ▽ key: Select program pattern No.
RUN key: Start the program operation
RESET key: Stop and reset the program operation.

Security Function
Key lock from parameters setting and, operation can be inhibited by a password.

● Communication Functions

( For UP750-□□ only )
The instrument allows two communication ports and five types of communication protocols, and allows the simultaneous communication with two different instruments. The instruments to communicate are such as a personal computer, programmable logic controller, other UT750/UP750, and Digital I/O expansion module.

Communication Protocol
Computer link communication: Communication protocol with a personal computer, PLC communication modules, and more.
Ladder communication (BCD serial communication): Communication protocol with the ladder program on some programmable logic controllers.
MODBUS communication: Communication protocol with a personal computer or PLC.
Coordinated operation protocol: Protocol to realize Coordinated operation with other GREEN SERIES controller. UP750 is always configured as a master unit.
Digital input/output expansion (μ-Bus): Protocol to connect Digital I/O expansion module to increase the number of Discrete Input and Output.

**RS-485 Communication Interface**

Two types of RS-485 communication interface (conforms to EIA RS485) are available: High performance interface and general purpose interface. Both interfaces are available simultaneously according to usage.

**High Performance Interface:**

High performance RS-485 communication is available with Computer link, Ladder, Digital I/O expansion module, and Coordinated operation communication.

- Specification (Common for Computer link, Ladder, and Coordinated operation):
  - Maximum number of connectable controllers: 31 units max.
  - Maximum communication distance: 1,200 m max.
  - Communication method: 2 wire, half duplex, Start-stop synchronization system, Protocol free
  - Communication rate: 600, 1200, 2400, 4800, 9600 bps, 19.2k, 38.4kbps.

**General Purpose Interface:**

General purpose communication is interface available with Computer link, Ladder, Digital I/O expansion module communicaiton, Coordinated operation.

- Specification (Common for Computer link, Ladder, and Coordinated operation):
  - Maximum number of connectable controllers: 31 units max.
  - Maximum communication distance: 1200 m
  - Communication method: Two-wire half duplex or four-wire half duplex Start-stop synchronizations system, Protocol free
  - Communication rate: 1.25Mbps
  - Maximum communication distance: 15m max.

---

**Status lamps**

- Second PV (PV2)
- Time event (TME1 to 4), PV event (PVE1/2), alarm (AL1)
- Program operation (PROG), Reset (RST), Hold (HLD), Local operation (LOC),
- Loop 1 in Manual operation (MAN1),
- Loop 2 in Manual operation (MAN2),
- Cascade operation (CAS)

**Communication port for light loader**

Communicate with personal computer to transfer the parameter/program setting data and Custom computation data.

**Operational keys**

- Increase/Decrease the setting data (▲, ▼)
- Transfer the display (DISP), Operation mode selection (MODE), Setting Parameters/values (SET/ENT), Program pattern selection (△, PT No. ▼), Program operation Start (RUN), Program operation reset (RESET)

---

**Examples of Communication System Configuration Diagram**

1. **Computer link communication/MODBUS communication**
   - Personal computer
   - UP750 Program controller

2. **Ladder communication**
   - MELSEC-A
   - PLC

3. **Coordinated operation**
   - UP750 Program controller or UT750 Digital indicating controller
   - UT750 Digital indicating controller

4. **Digital I/O expansion module (μ-bus communication)**
   - UP750 Program controller
   - Digital I/O expansion module
## Hardware specifications

### Measured Input Signal Specifications

#### Measured Input Signal

**Number of input:** 1 or 2 points

**Input type, measurement input range and measurement accuracy:**

- Refer to the table below.
- Possible to select input type/measurement range by software.

**Sampling period:** 100, 200 or 500 ms (selectable)

**Burnout detection:** Available with Thermocouple, RTD, standard signal 0.4 to 2 V DC and 1 to 5 V DC input. Possible to specify a travel of upscale, downscale or off.

For DC voltage input, 0.1 V or less are downscaled or off.

*Performance in the standard operating conditions (at 23±2°C, 55±10% RH, and 50/60Hz power frequency)*

**Note 1:** The accuracy is ±0.3°C of instrument range ±1 digit for a temperature range from 0 to 100°C

**Note 2:** The accuracy is ±0.5°C of instrument range ±1 digit for a temperature range from -100 to 200°C.

**Note 3:** Available for only measurement input 2.

</table>

*1: Numbers in ( ) are the measurement input range codes that apply when the communication function is used.

*2: Provided only for room temperature range operation at 23±2°C, 55±10% RH, and 50/60Hz power frequency.*

*3: Input bias current: 0.05 μA (For T/C and RTD b-terminal)

Specified current (RTD): about 0.13 mA

Input resistance: TC/mV input 1 MΩ or more

DC Voltage input approx. 1 MΩ (approx. 8 MΩ for range 0.0 to 1.2 V of measuring input 2)

Allowable signal source resistance:

TC/mV input: 250 Ω or less: Effect from allowable signal source resistance 0.1 μV/Ω or less

DC Voltage input: 2 kΩ or less: Effect from allowable signal source resistance 0.01%/100 Ω or less

Allowable leadwire resistance (for RTD input): Maximum 150 Ω (one wire (Lead resistances of three wires must be equal.)

However, it must be 10 Ω (one wire for the range of -150.0 to 150.0°C.

Effect of wiring resistance: ±0.1°C/10 Ω
Allowable input voltage:
TC/mV/RTD: ±10VDC
DC Voltage: ±20VDC
Noise rejection ratio:
Normal mode: 40dB (50/60Hz) or more
Common mode: 120dB (50/60Hz) or more
RJC Error: ±1°C (15 to 35°C), ±1.5°C (0 to 15°C, 35 to 50°C)
Applicable standard:
TC/RTD: JIS/IEC/DIN (ITS-90)
Response time: 1 second or less, 63% (10 - 90%)

Auxiliary Analog Input
(For UP750-□ 1 only)
Functions: Remote setpoint input, compensatory input,
PV input of Cascade secondary-loop, etc.
Input type:
DC voltage input 0 to 2 V DC, 0 to 10 V DC,
0.4 to 2.0 V DC or 1 to 5 V DC (Settable
within the range)
Number of input: 1 point
Sampling period: 100, 200 or 500 ms
auxiliary analog input period is linked with
PV sampling period.
Input resistance: Approx. 1MΩ
Input accuracy: ±0.3%±1 digit of F.S.
for 0 to 2 V DC range
±0.2%±1 digit of F.S. for 0 to 10 V DC range
±0.375%±1 digit of F.S. for 0.4 to 2.0 V DC range
±0.3%±1 digit of F.S. for 1 to 5 V DC range.
Performance in the standard operating
conditions (at 23± 2°C, 55± 10% RH, and 50/60 Hz power frequency)

Retransmission Output
Any of the PV, target setpoint or control output is output.
Can be used as the 15 V DC loop power supply.
Number of output points: 1 or 2
Retransmission output 2 is available only when “relay” is selected as the control output
function.
Output signal: 4 to 20 mA DC, 0 to 20 mA DC, 20 to 4 mA
DC or 20 to 0 mA DC (0 mA or less
cannot be output)
Load resistance: 600 Ω or less
Output accuracy: ±0.1% of span±5% for 1 mA or less
Performance in the standard operating
conditions (at 23± 2°C, 55± 10% RH, and 50/60 Hz power frequency)
When using for 15 V DC loop power supply:
Supply voltage 14.5 to 18.0 V DC, maximum supply
current about 21 mA (with the protection
circuit at field short-circuit)

Control Outputs
One or two points can be selected from the following types,
according to the model codes and specified UP mode:

Current output:
Number of output: 1 or 2 points (for heating/cooling type)
(selected between voltage pulse output)
Output signal: 4 to 20 mA DC, 0 to 20 mA DC, 20 to 4 mA
DC or 20 to 0 mA DC
Load resistance: 600 Ω or less
Output accuracy: ±0.1% of output span±5% for 1 mA or less
Performance in the standard operating
conditions (at 23± 2°C, 55± 10% RH, and 50/60 Hz power frequency)
Voltage pulse output:
Number of output: 1 or 2 points (for heating/cooling type)
Output signal: ON voltage 12 V DC or more (lead
resistance 600 Ω or less), OFF voltage 0.1 V
DC or less
Resolution: 10ms or 0.1% of output value, whichever is
greater
Relay contact output:
Number of output: 1 or 2 points (for heating/cooling type)
Output signal: Three terminals (NC, NO, and common)
Contact rating: 250 V AC 3 A or 30 V DC 3 A (Load
resistance)
Resolution: 10ms or 0.1% of output value, whichever is
greater

Contact Inputs
Usage:
Program pattern switching, Local/Remote switching, HOLD, ADVANCE selection,
RUN/RESET switching, measured input selection,
and message interruption display.
Number of input: 7 points (23 points max. when using
Digital I/O expansion module).
Input type:
Non-voltage contact input or transistor open
collector input
Input contact rating: 12 V DC, 10mA or more
ON/OFF detection:
For non-voltage contact contact input:
ON=contact resistance 1 kΩ or less,
OFF=contact resistance 20 kΩ or more
For transistor input:
ON=2 V or less,
OFF=leak current 100 μA or less
Minimum detecting time: PV input sampling period x3

Contact Outputs
Usage:
Instrument alarm output, Cooling side output
for Heating/Cooling control (Transistor
contact output), Event output.
Number of output: 7 points (Relay output 3 points, Open
collector output 4 points), (23 points max.
when using Digital I/O expansion module).
Relay contact rating: 240 V AC 1 A or 30 V DC 1 A
(Common to COM terminal)
Transistor contact rating: 24 V DC 50 mA (Common to
COM terminal)

Expansion Digital I/O
Up to two Digital I/O expansion modules can be connected
to increase the number of Digital I/O.
Each 8 points of input/output per one module can be
accessed from the instrument.
Display Specifications
- Measured value (PV) display: 5 digit seven segment red color LED display, height of a letter: 20 mm
- Data display: 32 × 128 dot LCD display with back-light
- Status indicating lamp: LED

Conformance to Safety and EMC standards
- Installation category: CAT. II (IEC/EN61010, CSAI010) Pollution degree: 2 (IEC/EN61010, CSAI010)
- Measurement category: I (CAT. I: IEC/EN61010)
- Rated measurement input voltage: 10V DC max. (across terminals), 300V AC max. (across ground)
- Rated transient overvoltage: 1500V (Note)
- Note: It is a value on the safety standard which is assumed by IEC/EN61010-1 in measurement category I, and is not the value which guarantees an apparatus performance.
- EMC standards: Complies with EN61326
- During test, the controller continues to operate with the measurement accuracy within ±20% of the range.

Construction, Installation, and Wiring
- Structure: Dust-proof and Drip-proof front panel conforming to IP55.
- Material of the body: ABS resin and polycarbonate
- Case color: Black
- Weight: Approx. 1 kg or less
- Dimensions: 96W × 96H × 100D (From the front panel surface) (mm)
- Mounting: Direct panel mounting; mounting bracket, one each for upper and lower mounting
- Panel cutout dimensions: 92 3/4 × 92 3/4 (mm)
- Mounting position: 0° to +30° with respect to vertical panel surface.
- Wiring: M3.5 screw terminal (signals, power supply/ground)

Power Supply and Isolation
- Power supply: Rated voltage 100 to 240V AC, (±10%), 50/60Hz
- Power consumption: MAX. 20VA (MAX. 8.0W)
- Memory backup: Lithium Battery, Life Time approx. 10 years
- Withstanding voltage: Between primary terminal and secondary terminal: 1500V AC for 1 min.
- Between primary terminal and ground terminal: 1500V AC for 1 min.
- Between ground terminal and secondary terminal: 1500V AC for 1 min.
- Between two secondary terminal: 500V AC for 1 min.
- Between two primary terminals: 500V AC for 1 min.
- Isolation Resistance: Between power supply terminal and ground: 500V DC 20MΩ or more
- Grounding: Class I grounding (grounding resistance of 100Ω or less)

Isolation Specifications
- Measured input terminal 1: Isolated from Measured input terminal 2 and other input/output terminals. Not isolated from internal circuits.
- Measured input terminal 2: Isolated from Measured input terminal 1, other input/output terminals and internal circuits.
- Auxiliary analogue input terminal: Isolated from other input/output terminals and internal circuits.
- Control output (current output or voltage pulse output) and retransmission output: Not isolated between control output and retransmission output terminals. Isolated from other input/output terminals and internal circuits.
- Relay contact control output terminals: Isolated from other input/output terminals and input circuits.
- Contact input terminals: Not isolated from other contact input and communication terminals. Isolated from other input/output terminals and internal circuits.
- Relay contact event output terminals: Isolated from other input/output terminals and internal circuits.
- Transistor contact event output terminals: Not isolated between other open collector output terminals mutually. Isolated from other input/output terminals and internal circuits.
- RS-485 communication terminals: Not isolated between other communication terminals, and from contact input terminals. Isolated from other input/output terminals and internal circuits.
- Power supply terminals: Isolated from other input/output terminals and internal circuits.
- Ground terminal: Isolated from other input/output terminals and internal circuits.

Environmental Conditions
- Normal operating conditions:
  - Ambient temperature: 0 to 50°C 40°C or less in close mounting side-by-side.
  - Temperature change rate limit: 10°C/h or less
  - Mambient humidity: 90%RH (no condensation)
  - Ambient humidity: 20 to 90%RH (no condensation)
  - Magnetic field: 400 A/m or less
  - Continuous vibration (5 to 14Hz): amplitude 1.2mm or less
  - Continuous vibration (14 to 150Hz): 4.9m/s² or less
  - Vibration in short period: 14.7m/s², 15sec or less
  - Shock: 147m/s², 11ms
  - Installation altitude: 2000m above the sea level or less
  - Warm-up time: 30 minutes or more
- Transit/storage conditions:
  - Temperature: -25 to 70°C
  - Temperature change rate limit: 20°C/h or less
  - Humidity: 5 to 95%RH (non-condensing)
- Effects of operating conditions:
  - Effect of ambient temperature:
    - For Voltage/TC input: Within (±1μV/°C or ±0.01% of F.S./°C, whichever is greater.)
    - For Auxiliary input: Within ±0.02% of F.S./°C
    - For RTD input: Within ±0.05°C/°C (ambient temperature)
    - For analog output: Within ±0.05% of F.S./°C
  - Effect of moisture:
    - For Voltage/TC input: Within (±1μV/°C or ±0.01% of F.S./°C, whichever is greater.)
    - For Auxiliary input: Within ±0.02% of F.S./°C
    - For RTD input: Within ±0.05°C/°C (ambient temperature)
    - For analog output: Within ±0.05% of F.S./°C
  - Effect of pressure:
    - For Voltage/TC input: Within (±1μV/°C or ±0.01% of F.S./°C, whichever is greater.)
    - For Auxiliary input: Within ±0.02% of F.S./°C
    - For RTD input: Within ±0.05°C/°C (ambient temperature)
    - For analog output: Within ±0.05% of F.S./°C

Isolation Resistance:
- Between power supply terminal and ground: 500V DC 20MΩ or more
- Grounding: Class I grounding (grounding resistance of 100Ω or less)

Function Block Diagram for Custom Computation

The UP750 controller comes with built-in control functions and various controller modes (UP modes) that provide different I/O computing functions. These modes are designed to support their respective control applications. From these choices, you can choose one that best meets your application needs.

In some control applications, however, you may want to execute special computations based upon specific input data or have a contact output of a specific data item in a specific control sequence. To be able to meet these needs, the UP750 controller provides a separate controller mode with which you can freely program your own computations. Computing functions available in these modes are referred to as custom computations.

Custom computations allow you to perform a variety of calculations based on input and output signals. These calculations include not only the four arithmetic operations and logical operations but also ten-segment linear approximations, temperature and humidity computations, temperature-based correction coefficient computations, pressure-based correction coefficient computations, and so on. For example, you can use the four arithmetic operations to apply the desired type of correction to input signals, or use a logical operation to program a sequencing process that works between input and output contacts.

Custom computations are configured using the given methods of block connection, as shown in Figures below.

Custom Computations Applied to Input Signals

Custom Computations Applied to Output Signals
UP750 Single-loop Control (Model UP750-0□ or UP750-5□)

- Receiving 4-20 mA DC Current Signals with the Controller
  - When receiving 4-20 mA DC current signals, set the PV input type to 1-5 V DC (setpoint "41").

- Wiring can only be carried out for controllers with communication functions.
  - RS-485 communication

- PV input: * Not configured at factory before shipment
  - When receiving 4-20 mA DC current signals, set the PV input type to 1-5 V DC (setpoint "41").

- Auxiliary analog input
  - mV/V input
  - Default: 1-5 V DC

- Control output: Relay output
  - Relay contact output
  - Control output type: Time proportional PID
  - Retransmission output 1
  - Retransmission output 2

- Power supply
  - +5V

- Contact Transistor contact
  - Switch between the ON and OFF states of the DI1 to DI4 contact inputs to select from program pattern numbers 1 to 15.

  - 13 output
  - 14 output
  - 15 output

- CAUTION
  - If the external contact outputs are not alive with a tester or the like, connecting them is hazardous.

- Note:
  - Connecting a 250 Ω resistor to the terminals is optional.

- Load resistance: 600 Ω

Effect of power supply fluctuation (within rating voltage):
For analog input: Within (±1µV/10V or ±0.01% of F.S./10V, whichever is greater.)
For analog output: Within ±0.05% of F.S./10V

■ External Dimensions and Panel Cutout Dimension

Normal Allowable Deviation=± (Value of JIS B 0401-1999 tolerance grade IT18)/2

"N" stands for the number of controllers to be installed. However, the measured value applies if N ≥ 5.

Note: Using an optional custom computation building tool (Model LL200-E10) that runs on a personal computer, you can build a variety of computation (e.g., four arithmetic operations, logical operations, ten-segment linearizer computations, temperature compensation factor computations, and pressure compensation factor computations) to be applied to the controller’s I/O signals.

Specify suffix code according to the designated UP mode.
